

# Silverfort for PingOne DaVinci

Easily consume and aggregate Silverfort's identity-based risk alerts into your Ping Davinci flow to improve identity protection across all enterprise environments

Silverfort has partnered with Ping Identity to deliver detection and protection against identity-based risks with PingOne DaVinci's no-code orchestration service. Orchestration platforms integrate multiple applications and services to automate processes through flows or provide real-time data synchronization. Joint customers of Silverfort and Ping can now easily prioritize their identity-based risk alerts and take appropriate action. This partnership will enable users to leverage Silverfort's identity protection capabilities to create automated risk-detection flows with DaVinci.

## What is PingOne DaVinci?

PingOne DaVinci is a cloud orchestration service that allows users to construct user journeys across a variety of applications using a drag-and-drop interface. You can build and design your own workflows or refine one of the existing workflow templates to customize your user journeys.

## How Silverfort for DaVinci Works

The Silverfort platform provides real-time monitoring and risk analysis for every user authentication, access request, and identity threats. This Integration allows Silverfort risks to be modified both inbound and outbound based on the outcome of flows. The Silverfort Connector in Ping Davinci allows you to ingest real-time identity threats from Silverfort by integrating the connectors into your workflow. Additionally, the connectors allow dynamic Silverfort policy enforcement via risk updates in your workflow actions.

With this new integration, users will be able to see all identity-based data in one place, including attack methods, entities' risk levels, and user risk levels. Together, DaVinci and Silverfort will empower identity security and SOC teams to detect identity-based attacks in real-time, including brute force attacks, lateral movement, and account takeovers across all their hybrid environments.

## KEY BENEFITS

### Actionable Threat Detection

Get concrete alerts of identity threats directly into your DaVinci flow, such as lateral movement, Pass the Hash, Kerberoasting, and more.

### Real-Time Protection

Identify and prevent identity-based attacks that use compromised credentials directly into your Davinci flows.

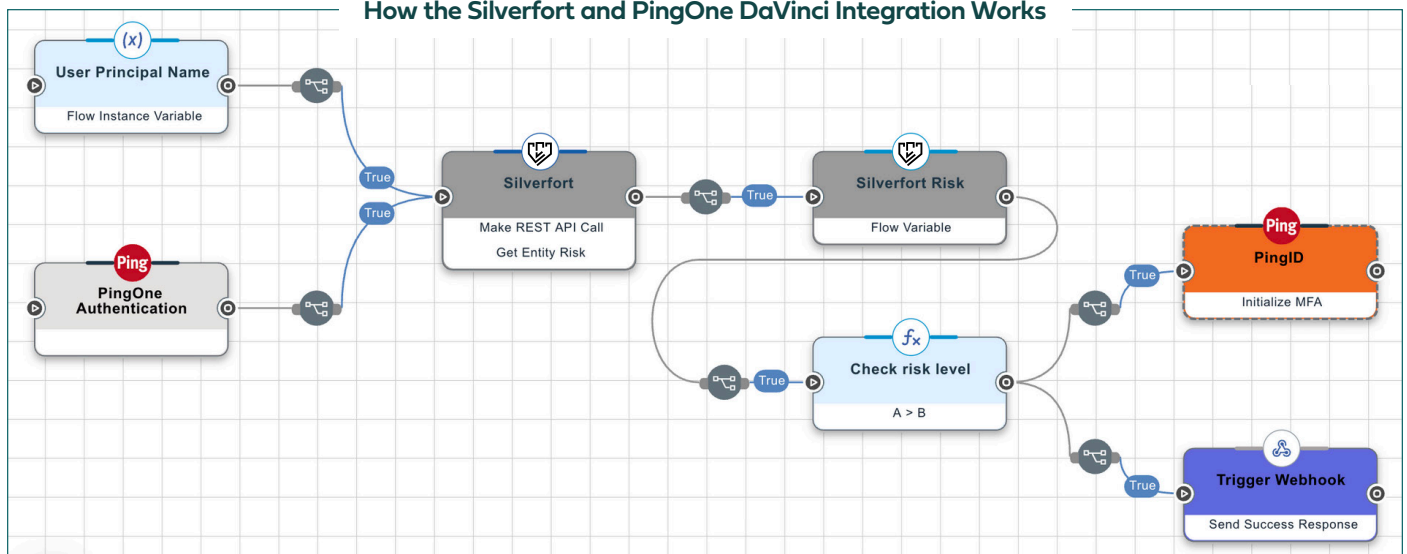

### Automated Risk Analysis

Utilize Silverfort's autonomous risk-scoring capability to mitigate all identity-based security risks.

### Optimized Investigation

Accelerate investigation time with granular forensic data on users, protocols, machines, and apps.

## How the Silverfort and PingOne DaVinci Integration Works

The Silverfort risk will be assessed after a PingOne authentication. If the risk is of a certain level, PingID MFA will be triggered and a webhook will be initiated.
